

# Enhanced Remediation with Semplicity & OX Security

SOLUTION BRIEF

## Incorporate Exceptional ASPM Context for Better Remediation Decisions

Empower remediation efforts with OX Security's enriched vulnerability data, combined with Semplicity's AI-driven platform for enhanced prioritization and streamlined remediation workflows. This collaboration increases cross-functional efficiency and strengthens overall security posture with actionable insights and automated workflows.

### SEMPPLICITY + OX SECURITY INTEGRATION

The Semplicity platform incorporates OX Security's contextualized vulnerability data to provide customers with AI-enhanced tailored remediation plans to address findings.

OX Security's Active ASPM data enhances prioritization by providing context and evidence for better understanding of exploitability, reachability, and business impact. This data is incorporated into the Semplicity platform and routed to remediation teams via automated workflows, with defined fix priority, descriptions and next steps, optimizing cross-functional collaboration and efficiency, and improving overall security posture.

Semplicity enables security teams to record, monitor and communicate effectively throughout the entire remediation process, simplifying complex remediation processes, internal audits and quality checks.

## What Our Customers Are Saying

*"Great Platform for vulnerability aggregation, orchestration and automation.."*

*Application Security Engineer  
Consumer Goods*

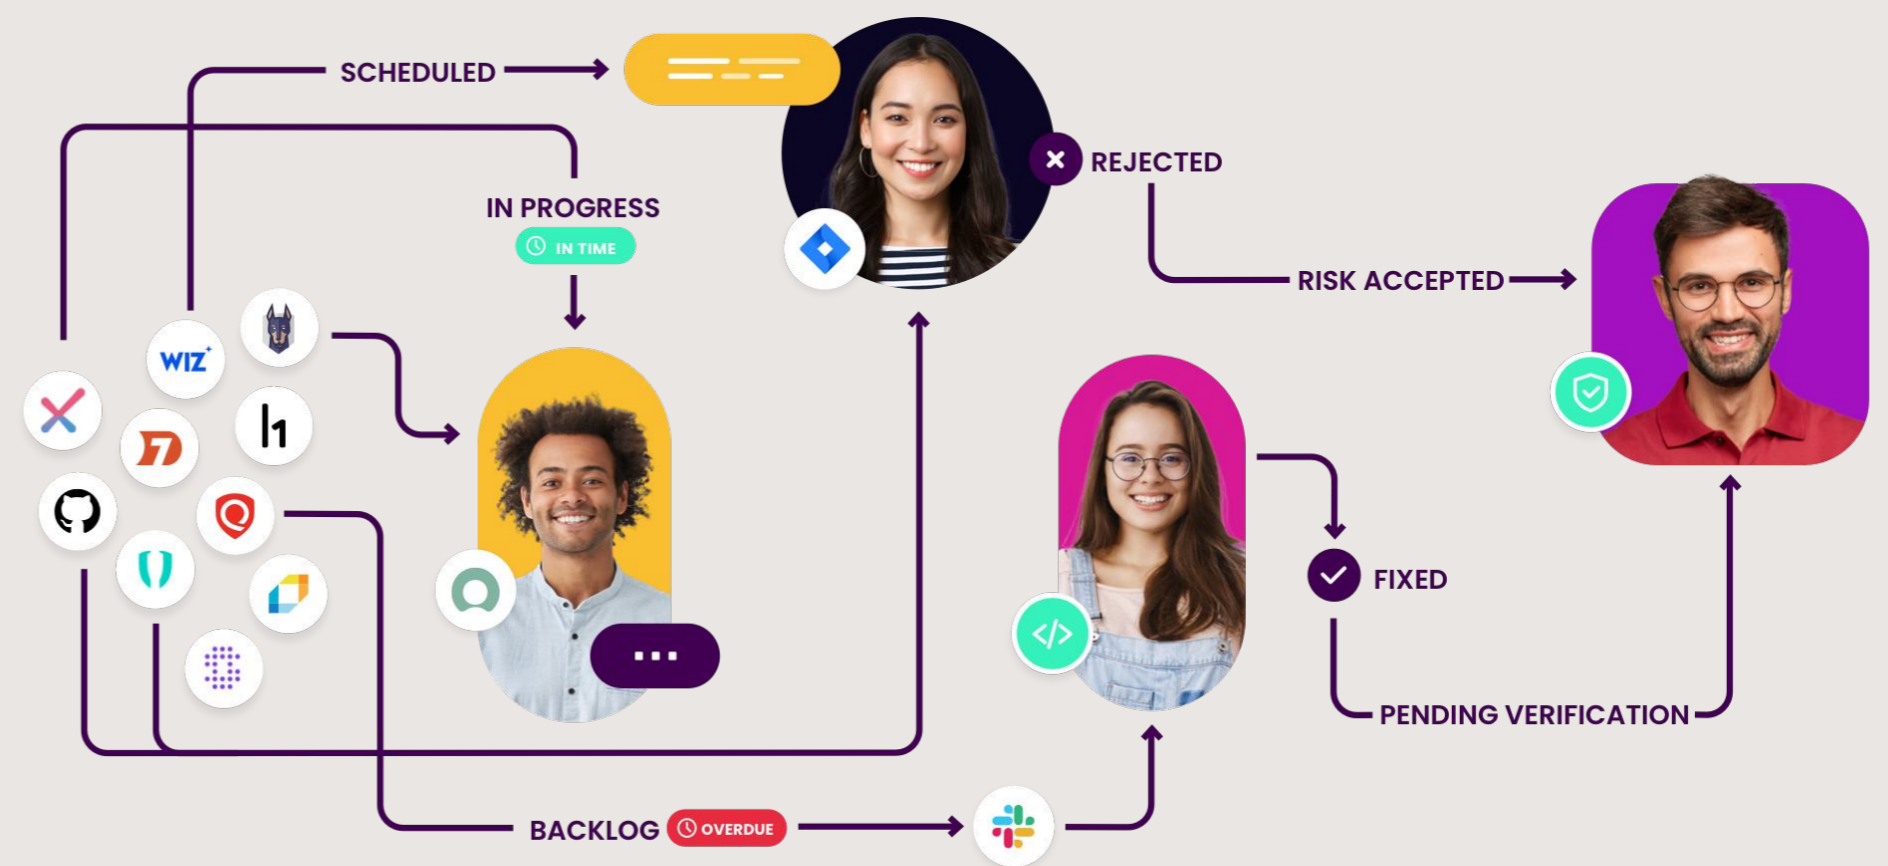

*"Customizable, intuitive, and straightforward."*

*IT Security & Risk Management  
Associate Energy and Utilities*

# Better Together

## ACCELERATED RISK REDUCTION

The Seemplicity platform consolidates data from OX Security with all your other vulnerability findings, automates remediation processes and workflows, and manages remediation requests between security and fixing teams. This virtually eliminates the time required to coordinate and prepare requests, improving Mean Time to Remediation (MTTR) overall while maintaining consistent quality in remediation.

## MULTI-FIXER QUEUE MANAGEMENT

Scanning data is transformed from vulnerability noise into actionable, tailored remediation plans to define who needs to do the work, what is vulnerable, and how remediation is to be accomplished. Customized multi-fixer queues ensure remediation teams efficiently address the most critical vulnerabilities, misconfigurations and exposures first.

## PROCESS COMPLIANCE

The fixing process is streamlined, simplifying internal audits and quality checks. Continuously monitoring remediation progress identifies bottlenecks, allowing organizations to address issues and meet SLAs. By providing a clear record of remediation activity, Seemplicity helps organizations enforce and review their remediation protocols efficiently, enhancing overall process integrity and accountability.

### About Seemplicity

Seemplicity is remediation, simplified. By enabling smooth integration, cross-team collaboration, and scalability, Seemplicity yields unmatched cost savings and risk reduction for any organization.

### About Ox Security

Founded by Neatsun Ziv and Lion Arzi, two former Check Point executives, OX is the first and only Active Application Security Posture Management (ASPM) Platform, consolidating disparate application security tools (ASPM+AST and SSC) into a single console. By merging best practices from risk management and cybersecurity with a user-centric approach tailored for developers, it offers complete security, prioritization, and automated remediation of security issues throughout the development cycle, enabling organizations to release secure products quickly.
